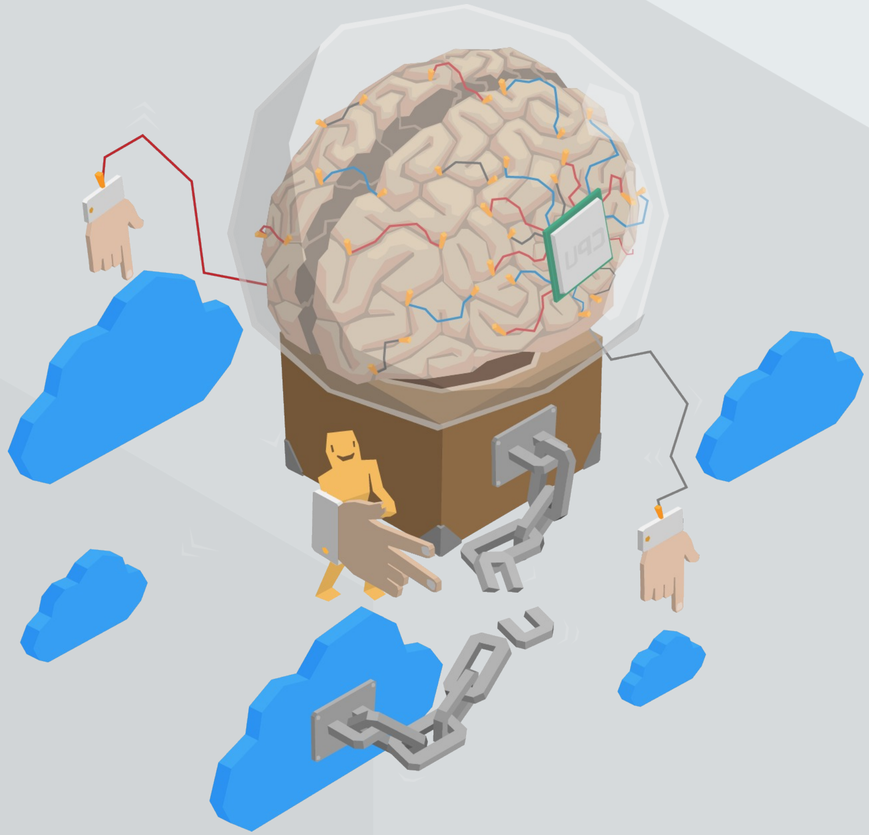
Contents



This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

From PC to Cloud Computing

- In former times:
  - **Powerful desktop PC (personal computer)**
  - Fast CPU, large harddisk(s)
  - Disadvantage: expensive and maintenance-intensive
- Today (or in near future):
  - Laptop or tablet PC
  - **Energy-efficient components** (battery-powered)
  - **Cloud applications**, e.g.:
    - Software as a Service, web mail, calender, office, photo management, ...
    - Storage space (DropBox, ...)

A „normal“ user mainly works in the web browser!

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

Smartphone and Cloud Computing

- Smartphone
  - Small storage space (or expensive)
  - Not extensible (e.g. SD card slot)
- Cloud connection
  - **Storage space**
    - Pictures, videos, music
    - Documents
  - **Applications**
    - Computation-intensive applications in the cloud (z.B. voice recognition)

Cloud connection is a major component of smartphones!

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

The Challenges

Cloud Computing is convenient with good network connectivity!

- Challenge: network communication
  - Bandwidth
  - Latency
  - Mobility

How does Cloud Computing work?
(and, by the way, what is the „Cloud“?)

What is the „Cloud“?

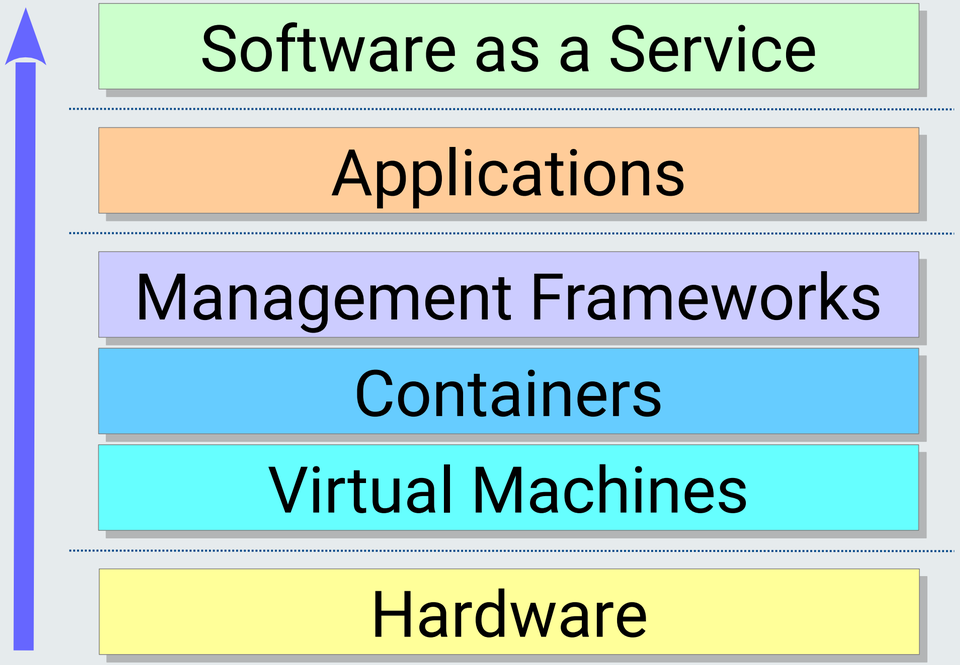
Cloud Computing – A Technical Overview

- From bottom to top
  - Hardware
  - **Virtualisation**
  - Management Frameworks
  - Applications
  - Software as a Service (SaaS)



This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

Hardware in External Data Centres

- User's Local PC:
  - Low utilisation
  - Main task: do nothing!

- Idea: many computers, for very many use
  - **Computers in a data centre**
  - Usage by many users
    - Temporal distribution of the users
    - High utilisation
    - Low costs

Multiple customers per computer?

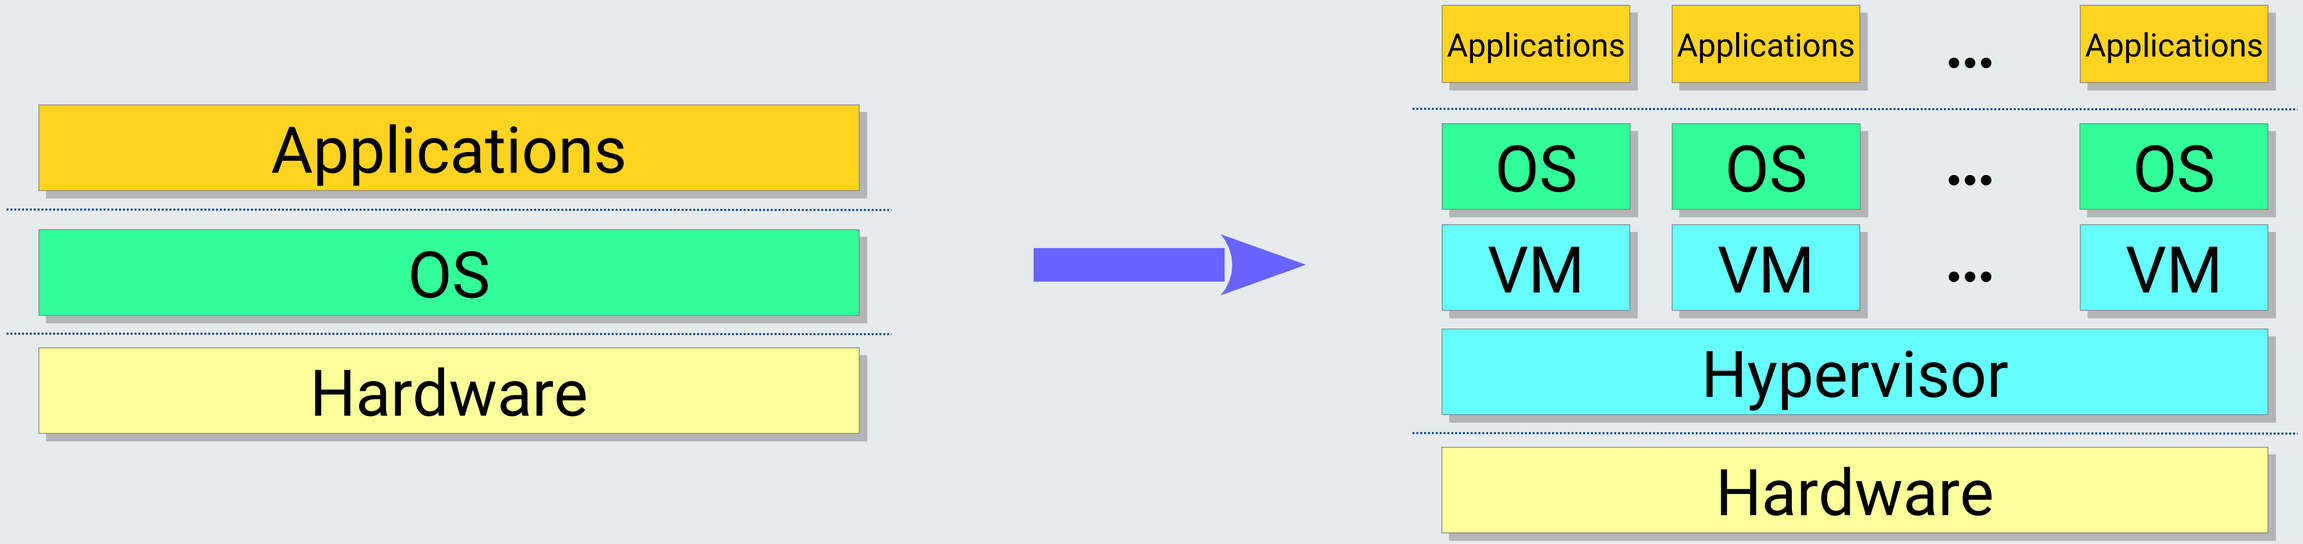
This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

Virtual Machines: Basics

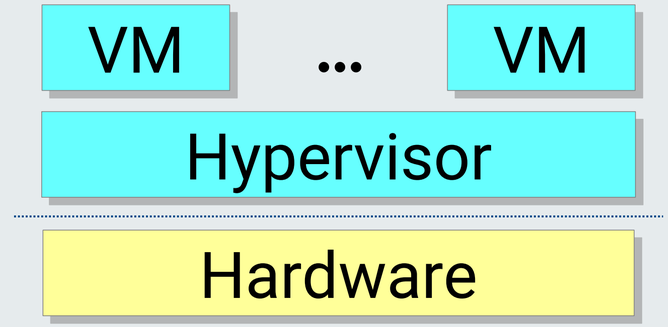
- Virtualisation: „sharing" of hardware by using a hypervisor
- Virtual Machines (VM):
  - Own virtual hardware (CPUs/cores, memory, network, storage)
  - Own operating system (OS) within the VM
  - Hypervisor may emulate "standard" hardware → no problems with drivers



This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

Virtual Machines: Different Variants

- Hypervisor
  - **Type 1**: Runs directly on the hardware
    - e.g. VMware ESXi
  - **Type 2**: Part of "normal" operating system
    - KVM (Kernel-based Virtual Machine) in Linux,
    - VirtualBox, etc.



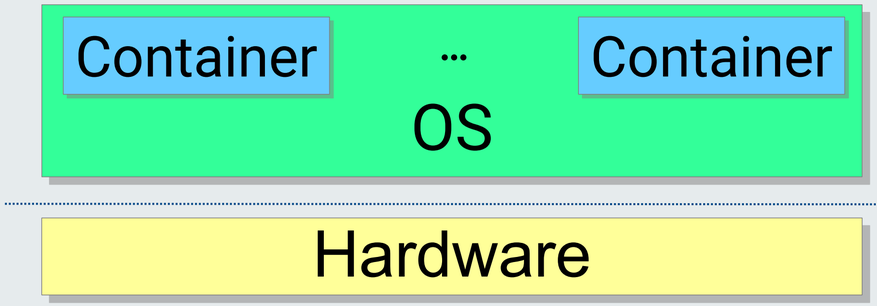
- Para-virtualisation
  - Instead of emulating virtual hardware: just pass through OS calls
  - Requires OS adaptation/drivers

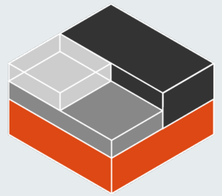
Full operating system in every VM → overhead

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

Containers

- Container
  - One OS kernel, multiple restricted areas (containers)
  - Each container „sees“ only
    - **Own processes**
    - **Own virtual network interfaces**
    - **Own view on file systems**
    - **…**
  - OS manages containers – has access to everything
- Widespread implementations:
  - Linux Containers (LXC) and FreeBSD Jails





Low overhead, but restriction to the same kernel

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

Management Frameworks

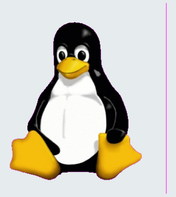
VMs and containers are convenient! But how to manage them?

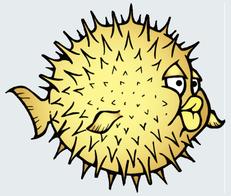
- Orchestration
  - Instance management:
    - **create, remove, migrate, backup, restore, configure, ...**
  - Service monitoring:
    - **Is everything running, or are there problems somewhere?**
- Well-known management frameworks:
  - OpenStack
  - Docker
  - Kubernetes
  - and many more!

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

Applications for VMs and Containers

- „I need a web-server with database“
  - New container from template
    - **Ubuntu Server + Apache + PostgreSQL**
    - **…**
  - VM with Windows + IIS + Oracle
- „I need a FreeBSD system for kernel tests“
  - FreeBSD-VM from template
  - Snapshot/restore possible
- …





The „normal“ user just wants to use his application!

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

Software as a Service (SaaS)

- Instead of own VMs/containers:
  - Subscribe to a complete service (e.g. as web application)
  - Provider takes care for everything

- Examples:
  - Microsoft Office 365
  - Google Apps (Mail/Drive/Photos/…)
  - Yahoo (Mail/Flickr/…)
  - GitHub, BitBucket, …

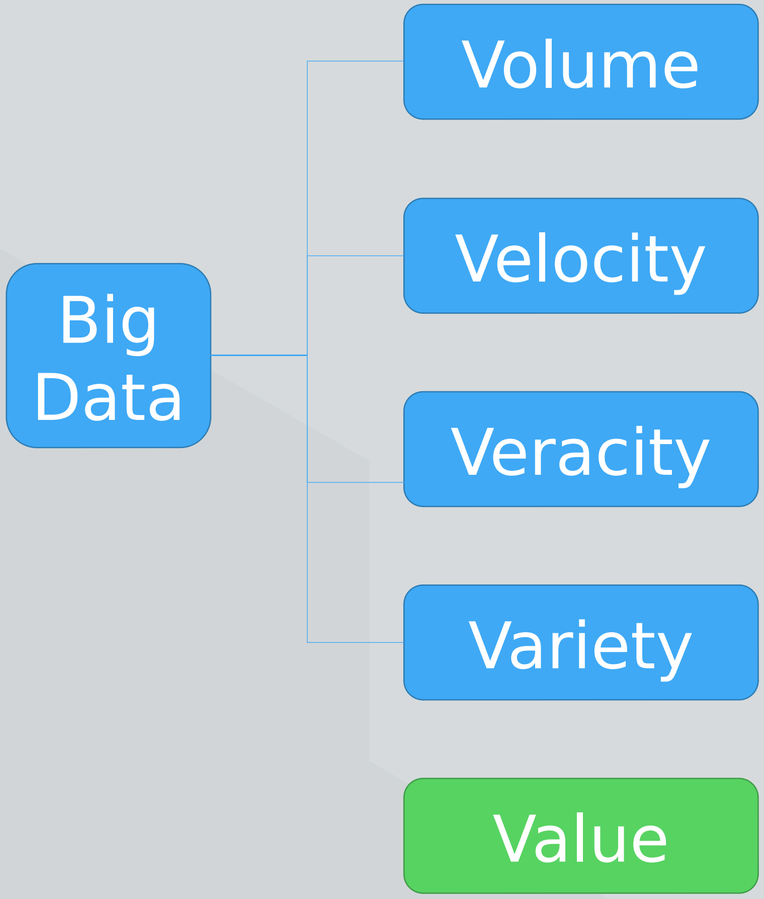
Office 365
Google
YAHOO!

Very simple and convenient for the "normal" user!

Melodic
Big data cloud

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

Social innovations in modern era increasingly rely on our capacity to process large datasets



Big data needs big resources!

- Digital Universe – Expected to grow to 44 ZiB in 2020
- Internet-of-Things – 30.7 billion devices by 2020
- Social Networks and Multimedia – 500 million tweets per day; 510,000 comments and 136,000 photos per second on Facebook!
- Biological Data – Vast amount of data available for researchers, 1000 Genome project, 100,000 Genome project, TiB to EiB!

1 TiB = 1024^4 = 1,099,511,627,776 bytes
1 EiB = 1024^6 = 1,152,921,504,606,846,976 bytes

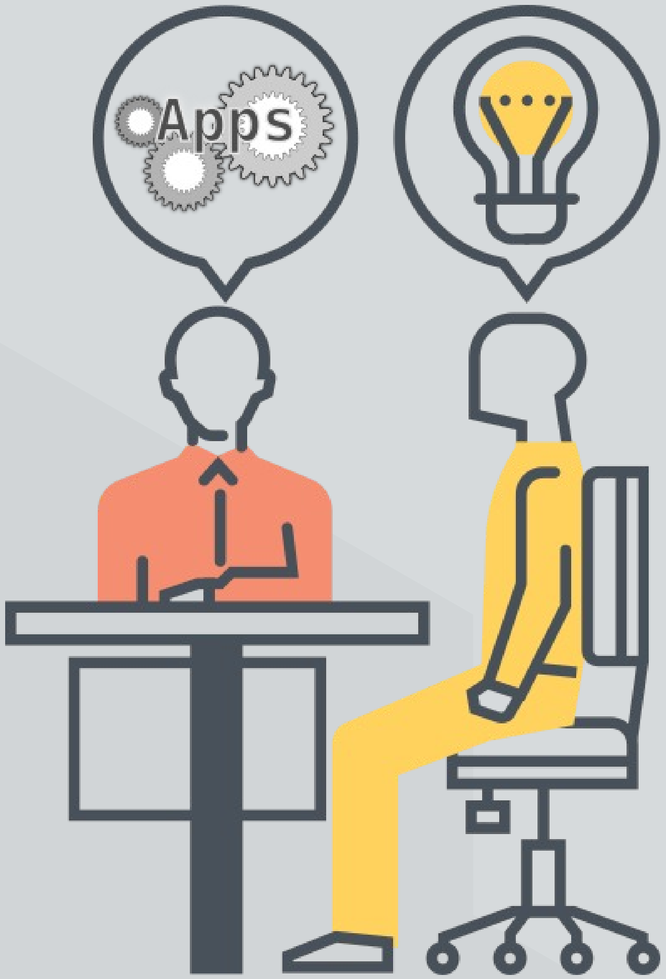
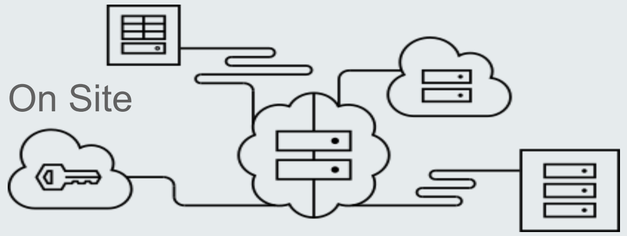
Big data cloud

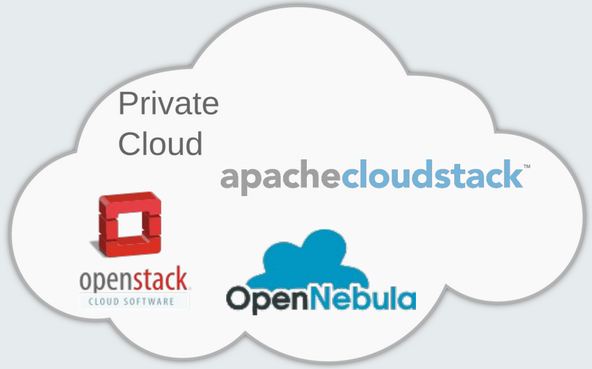
This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

Currently, users are restricted to static deployment choices for data-intensive applications





- ✗ Cost Effectiveness
- ✗ Management Flexibility
- ✗ Resource Utilization
- ✓ Privacy and Confidentiality

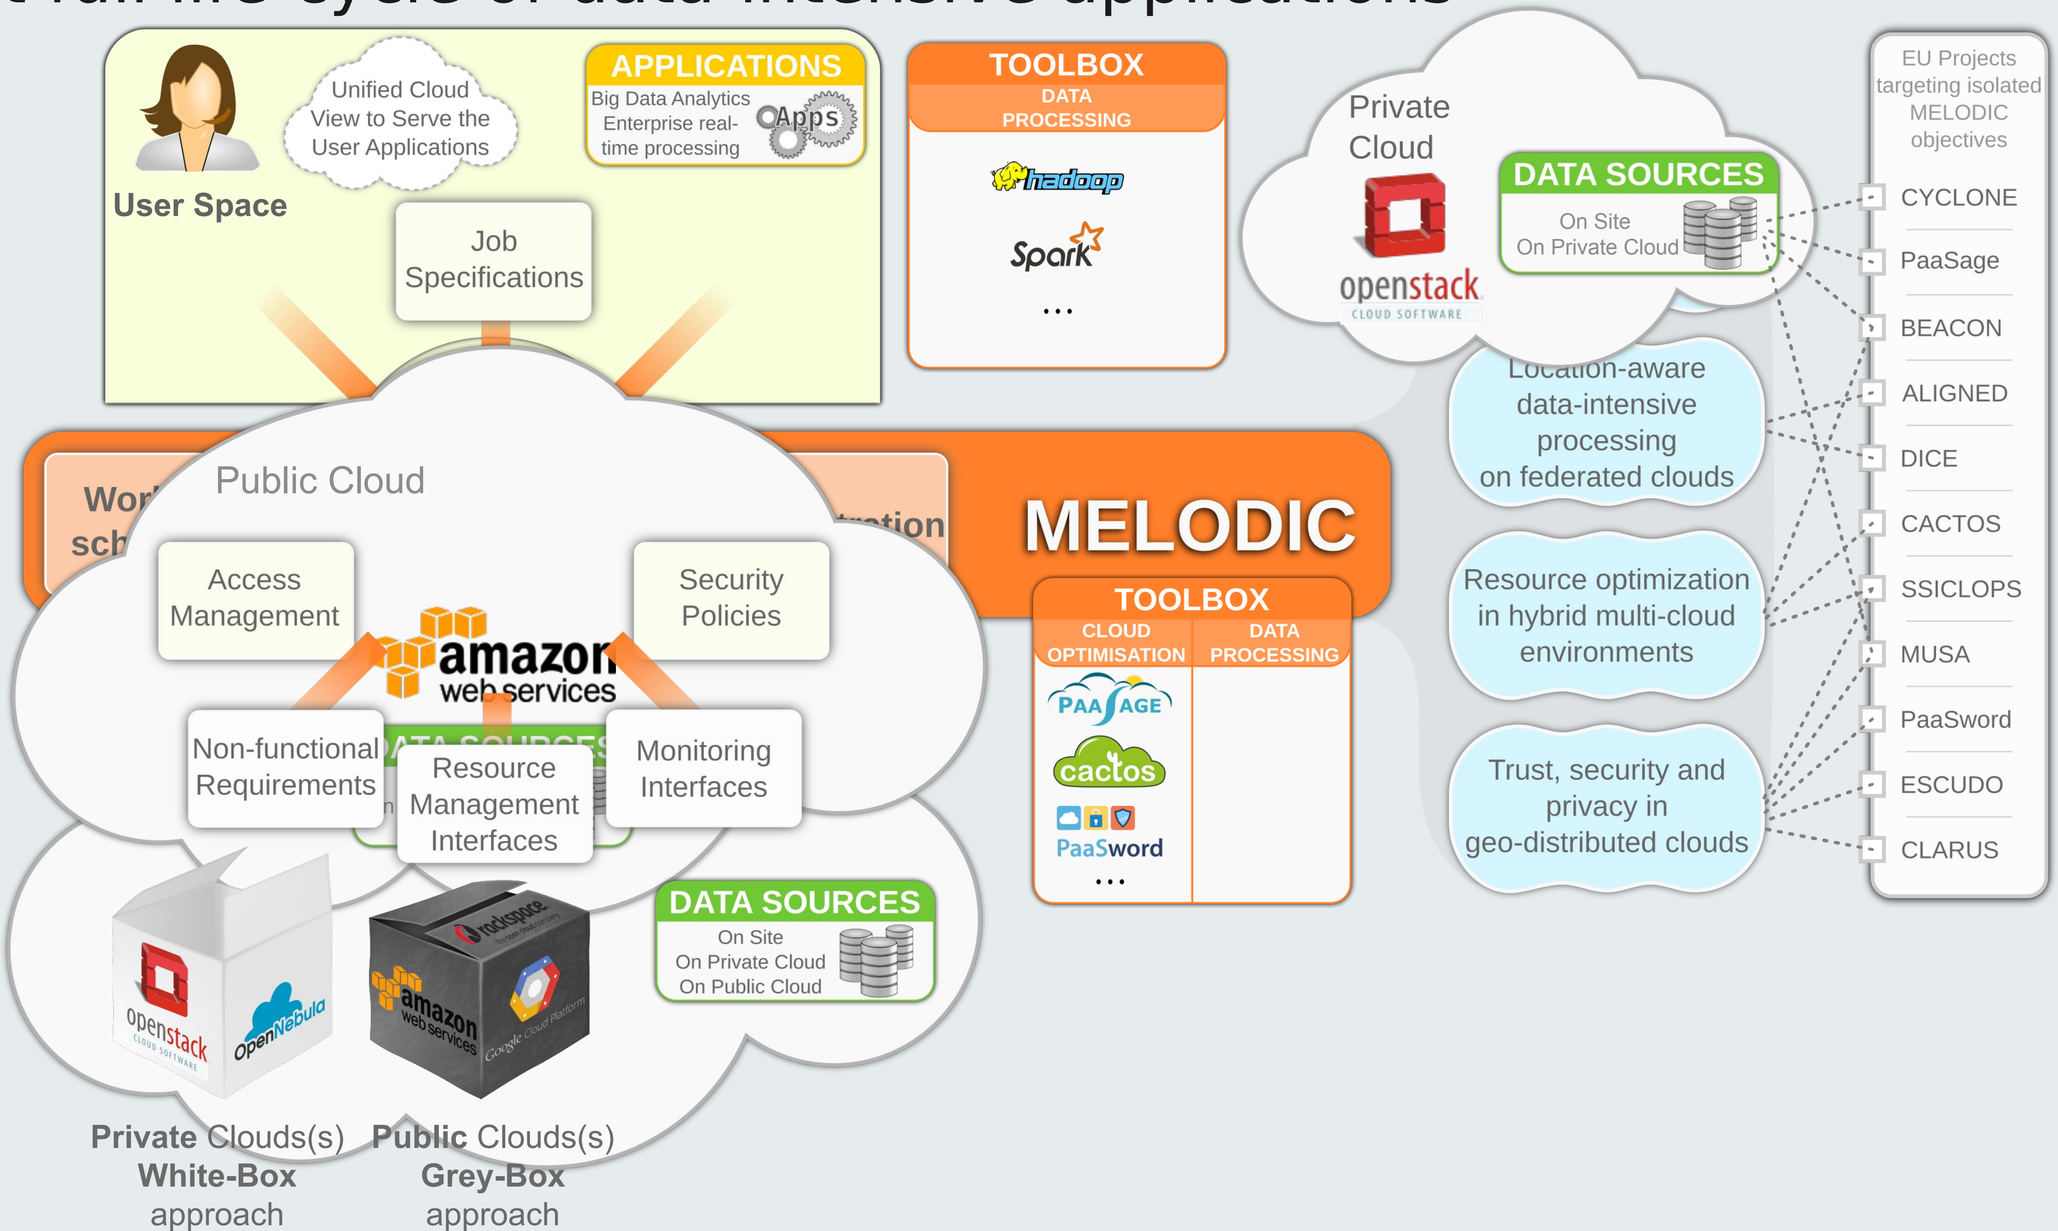


- ✗ Cost Effectiveness
- ✓ Management Flexibility
- ✓ Resource Utilization
- ✓ Privacy and Confidentiality

- ✓ Cost Effectiveness
- ✓ Management Flexibility
- ✓ Resource Utilization
- ✗ Privacy and Confidentiality
- ✗ Vendor Lock-In

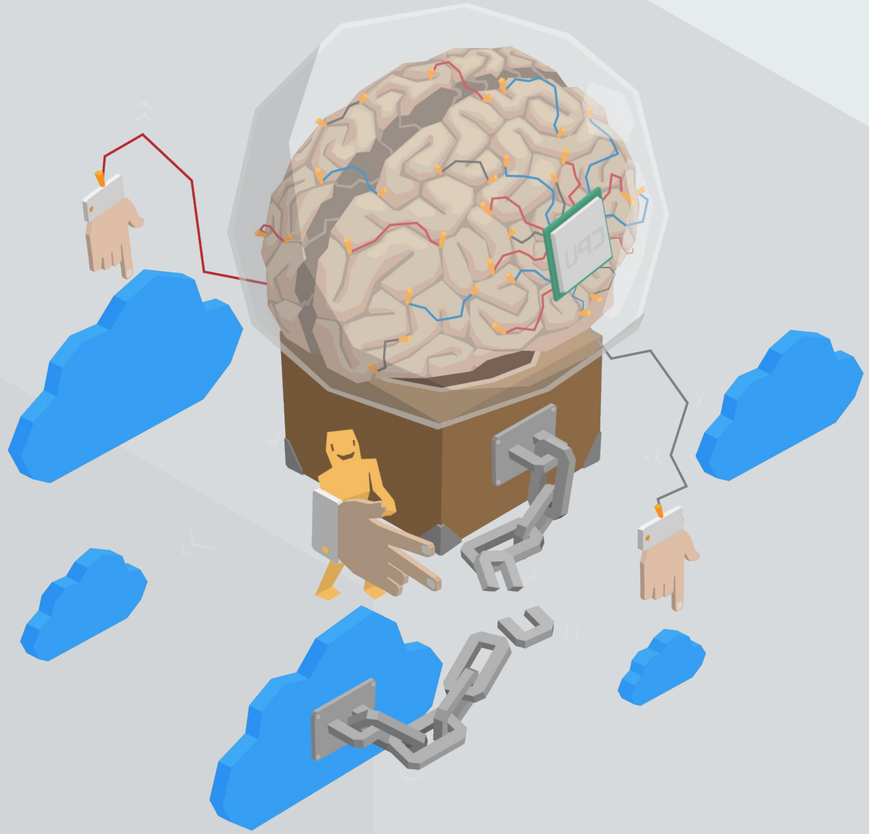
This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

Melodic is infrastructure-agnostic, support full life-cycle of data-intensive applications



Melodic
Big data cloud

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664



A Complete solution for data-intensive applications

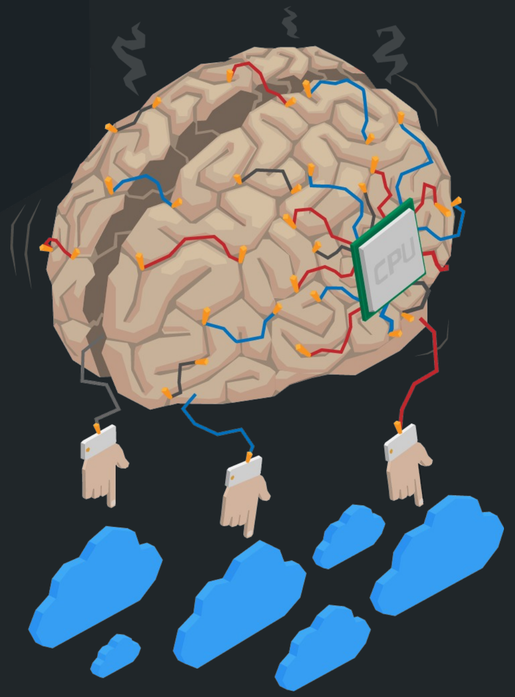
- Transparent deployment and execution of data-intensive applications on multi-clouds
- Holistic data life-cycle management
- Runtime adaptation and automatic elasticity for cloud applications
- Secure and privacy-aware data access
- Optimal usage of distributed private infrastructures with federated clouds

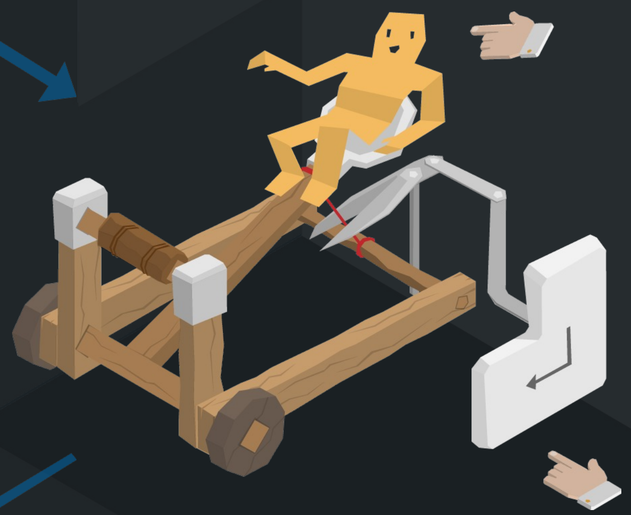
Melodic
Big data cloud

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

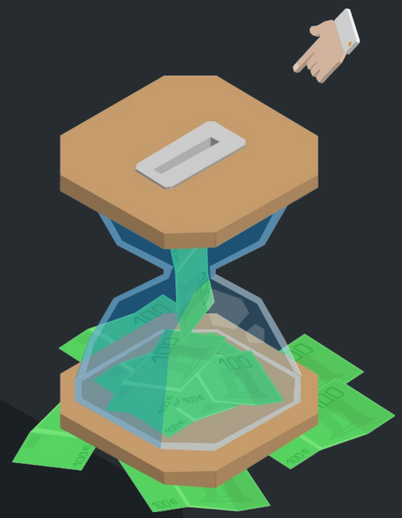
Big Data Cloud Made Easy!

Melodic calculates best multi-cloud options for your applications





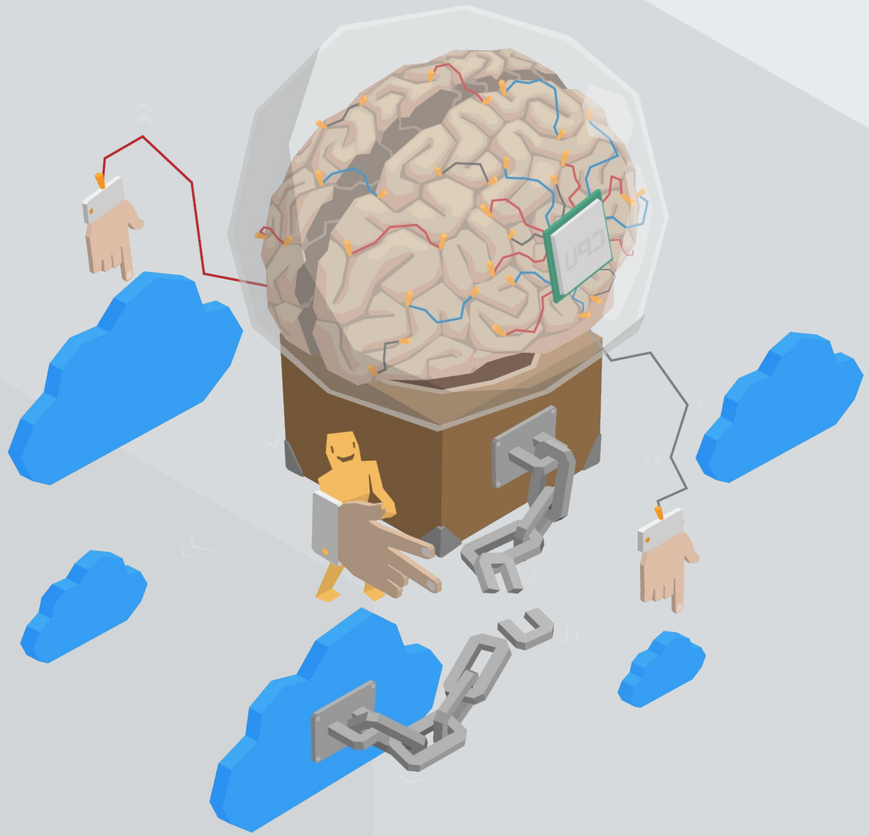
Automatic deployments and Adaptation



Improved performance at lower costs!

Melodic
Big data cloud

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664



BIG IDEA:
AVOID VENDOR LOCK-IN

This is what we believe in:

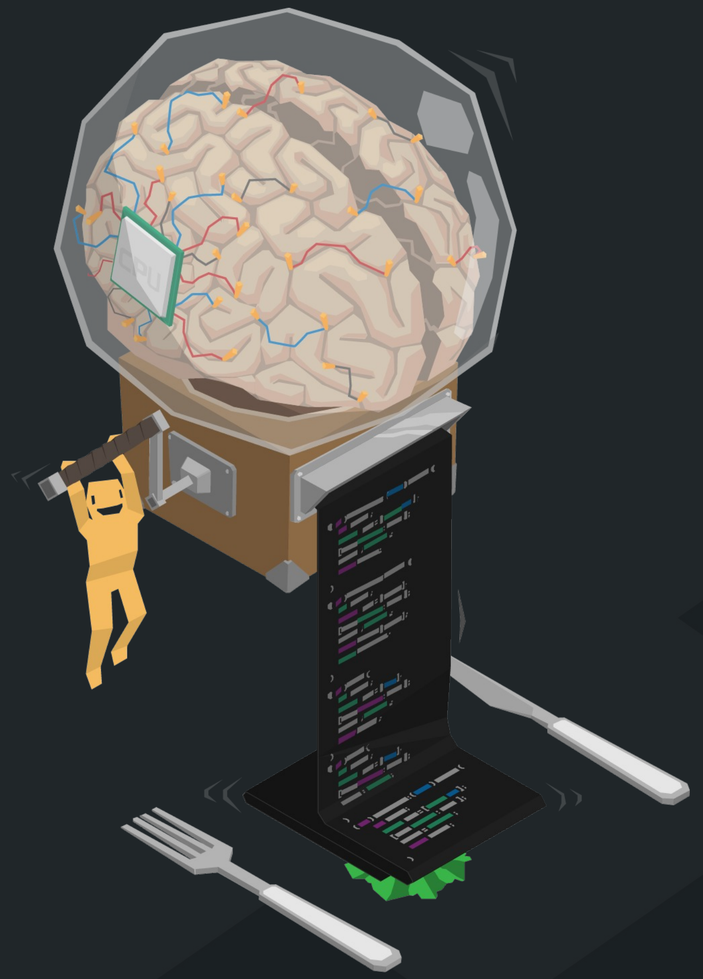
- Cloud-future with competition not monopoly.
- Choice, change & opportunities.
- Multi-cloud complexity made simple and manageable.

Melodic
Big data cloud

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

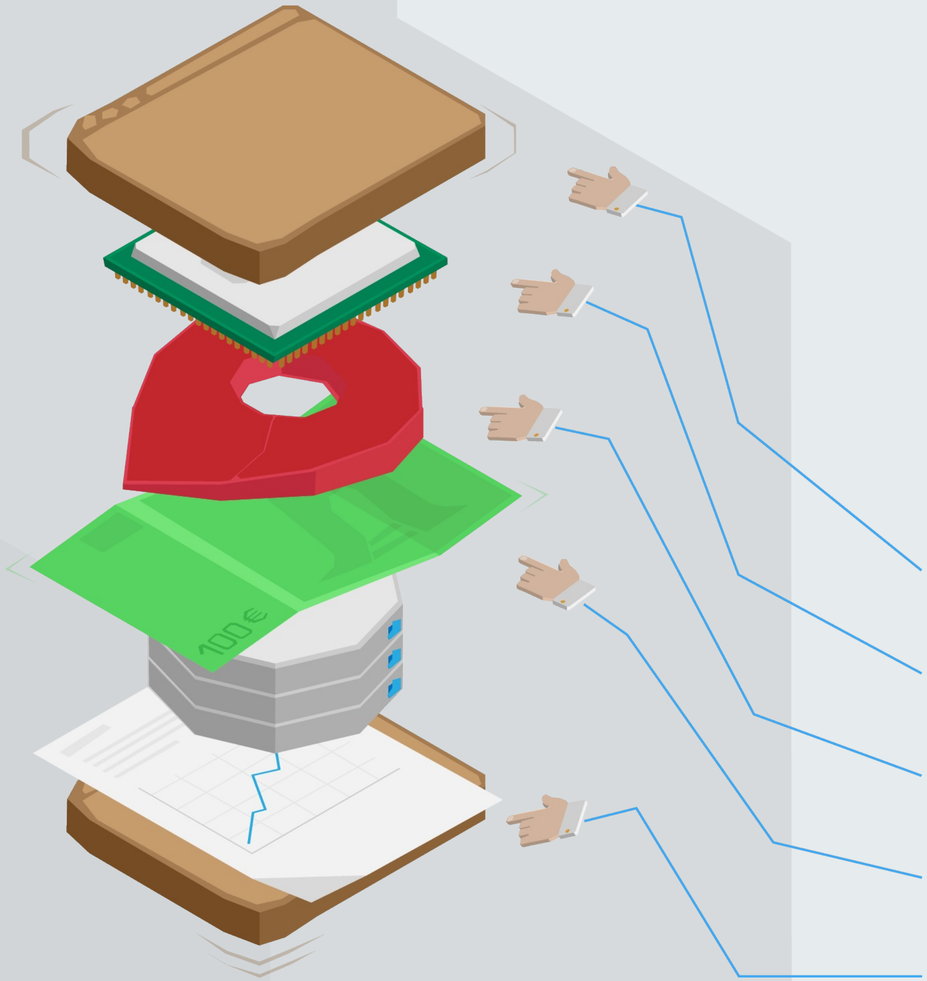
OPEN SOURCE
OPEN STANDARDS

We believe that open source projects promote innovation faster than proprietary solutions.



Melodic
Big data cloud

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664



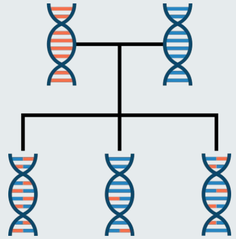
JUST TELL MELODIC
WHAT YOU NEED

Specify your needs once and forget about differences between cloud operators, multiple admin panels and other headaches.

- provisioning? deployment?
- scalability? service level?
- jurisdiction?
- cost concerns?
- monitoring?

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

Melodic will be demonstrated with four selected use-cases (covering different deployment aspects and user requirements)



Genome Analysis

- Strict Data Confidentiality, Performance Optimization, Cost Effectiveness

Road Traffic and People Flow Monitoring

- Real-time Processing, On-Demand Processing, Geo-dispersed Big Data, Data privacy

Secure Document Management

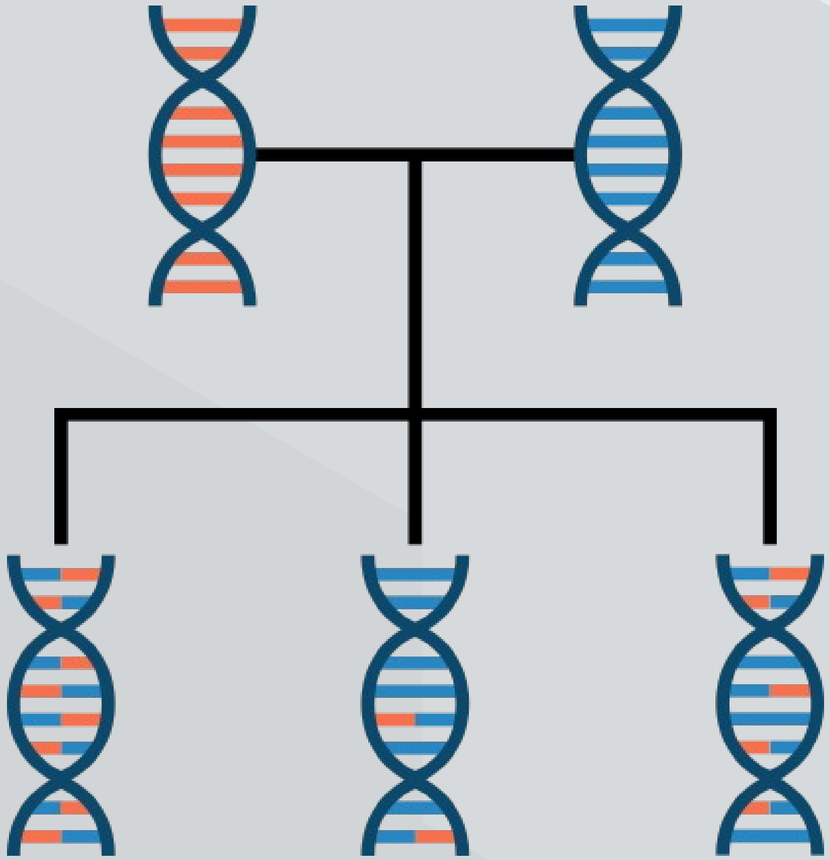
- Data Life-cycle Management, Performance Optimization, Commercial Exploitation

Marketplace for Data-Intensive Apps

- Transparent Deployment, Runtime Adaptation, Automated Elasticity

Melodic
Big data cloud

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664



Use Case:
Genome Analysis

Białystok University provides application prototype enabling robust approach for the discovery of synergistic variables in biological datasets, with a main focus on data from gene expression studies and genome-wide association study (GWAS).

Melodic enables:

- Utilize cloud computing processing power and scalability
- Minimize data processing costs
- Use innovative solutions (like GPUs) to speed up

Melodic
Big data cloud

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 731664

MELODIC CASE STUDY: CE-TRAFFIC

Melodic helps CE-Traffic calculate road traffic and people flow information

- Effortless switching between cloud providers minimizes cost.
- Big-data-cloud complexity made easy.
- On-time results.

CE-Traffic
